

1. (Amended) A substance encapsulation system capable of being apertured under a tensioning force, said system comprising:

- A1
- (a) a first web and a second web, said first and second webs joined to one another in a face-to-face relationship by a plurality of bond sites, each bond site defining a discrete, noncontinuous elongated melt weakened region having an aspect ratio of at least about 2, said bond site having a longitudinal axis oriented in a first direction and a transverse axis oriented in a second direction orthogonal to said first direction;
  - (b) a powdered, granular, particulate, or gel substance disposed between said first and second webs; and
  - (c) wherein upon application of a sufficient force having a vector component parallel to said transverse axis, said bond site fractures to form a corresponding aperture to facilitate exposure of said substance.

2. Deleted ✓

7. (Amended) A substance encapsulation system comprising:

- A2
- (a) a first web and a second web, said first and second webs joined to one another in a face-to-face relationship by a plurality of bond sites, each bond site defining a discrete, noncontinuous elongated melt weakened region having an aspect ratio of at least about 2; and
  - (b) a central layer being disposed between at least a portion of said first and second webs, said central layer containing a substance to be exposed.

21. (New) The substance encapsulation system of Claim 1, wherein the bond sites have a length of less than about 0.2 inches.

A3

22. (New) The substance encapsulation system of Claim 1, wherein the bond sites have a width of less than about 0.02 inches.
23. (New) The substance encapsulation system of Claim 1, wherein the bond sites have a length of less than about 0.1 inches.
24. (New) The substance encapsulation system of Claim 1, wherein the substance is continuously disposed between said first and second webs.
25. (New) The substance encapsulation system of Claim 7, wherein the bond sites have a length of less than about 0.2 inches.
26. (New) The substance encapsulation system of Claim 7, wherein the bond sites have a length of less than about 0.1 inches.
27. (New) The substance encapsulation system of Claim 25, wherein the bond sites have a width of less than about 0.02 inches.
28. (New) The substance encapsulation system of Claim 7, wherein the central layer is continuously disposed between at least a portion of said first and second webs.
29. (New) A substance encapsulation system capable of being apertured under a tensioning force, said system comprising:
- (a) a first web and a second web, said first and second webs joined to one another in a face-to-face relationship by a plurality of regularly repeating bond sites, each bond site defining a discrete, noncontinuous elongated melt weakened region having a length of less than about 0.2 inches and a width of less than about 0.02 inches, said bond site having a longitudinal axis oriented in a first direction and a transverse axis oriented in a second direction orthogonal to said first direction;
  - (b) a powdered, granular, particulate, or gel substance continuously disposed between said first and second webs; and
  - (c) wherein upon application of a sufficient force having a vector component parallel to said transverse axis, said bond site fractures to form a corresponding aperture to facilitate exposure of said substance.
